# WISCONSIN'S LAKE MICHIGAN SALMONID STOCKING SUMMARY

Prepared by Thomas Burzynski  
Lake Michigan Fisheries Work Unit Milwaukee – UW WATER Institute  
Department of Natural Resources

This stocking summary is based on stocking records entered by Wisconsin DNR staff into the statewide propagation database. A stocking record was generated each time hatchery fish were stocked into Lake Michigan.

There are four types of information included in this summary report. First, total numbers of trout and salmon stocked from 1963-2016 are summarized. The numbers of trout and salmon that were requested for stocking during the current year (2018) are also included. The actual numbers of each species of fish stocked this year will depend on hatchery program production. The first summary (pages 2 and 3) is intended to provide an overview of long-term trends in the stocking of each species.

The last three sets of summaries account for fish stocked during 2013-2017. The second set (pages 4 - 7) focuses on the numbers of fish stocked in each county along the Lake Michigan shoreline in 2013-2017. The third summary (pages 9 - 28) is a set of tables detailing specific stocking sites, the grid location of each stocking site, the specific number and age of fish planted at each site, and any identifying fin clips or marks. The fourth summary (pages 30 - 33) focuses on the marked trout and salmon stocked during the past five years (marked lake trout and steelhead are listed from 2006 and 2008 to the present respectively).

Detailed stocking information for 2013-2017 was provided since this year's harvest of all species, except lake trout, will be based primarily on fish stocked in those years. For example, this year's coho catch will depend largely on yearling coho stocked in 2017. The pattern for brown trout tends to be similar to coho. The catches of rainbow (steelhead) trout this year will result for the most part from yearling fish stocked from 2011-2015. Chinook catches this year depend primarily on Chinooks stocked in 2015-2017. The lake trout catch, unlike the other species, will depend strongly on fish stocked in 2010 and earlier.

A grid map of Lake Michigan (Figure 1) is included to assist you in locating stocking sites. The ages of fish at time of stocking are indicated as fingerling (F), spring fingerling (SF), yearling (Y), or adult (A). Fin clips are coded as single or multiple clips of the following fins and/or mouth parts: adipose (A), dorsal (D), right or left maxillary (RM, LM), right or left pectoral fins (RP, LP), or right or left ventral fins (RV, LV). The acronym CWT used in the summaries stands for coded wire tag and refers to fish that have a small wire tag inserted into their snouts. All Chinook salmon stocked in the Wisconsin waters of Lake Michigan were marked with an adipose clip and a CWT as part of a lakewide effort to determine the rates of natural reproduction in Lake Michigan. A diagram of a Chinook salmon depicting fin and maxillary locations is included with the summary (Figure 2).

A strain designation code is included in the fin clip column. Strains are coded as Domestic (D), Seeforellen (S), Lake Michigan (M), Arlee (A), Chambers Creek (C) and Ganaraska (G).

## **2017 Stocking Overview:**

Lakewide Chinook salmon stocking numbers were reduced by 50% starting in 2013 based on agreements with other management agencies on Lake Michigan. This agreement was forged to balance the number of predators with available prey. The actual number of Chinook salmon stocked in 2017 exceeded our proposed objective of 810,000 by approximately 3,300 fish. The number of brown trout stocked in 2017 exceeded our proposed objective of 362,000 by approximately 6,500 fish. Stocking of steelhead exceeded the production goal of 390,000 by approximately 33,000 fish. Coho salmon stocking fell short of our objective of 450,000 by approximately 4,000 fish. Lake trout stocking by the U.S. Fish and Wildlife Service fell short of expectations by approximately 1,700 fish.

**WISCONSIN'S LAKE MICHIGAN SALMONID STOCKING SUMMARY**
