Wisconsin's Lake Michigan Salmonid Stocking Summary

Prepared by Timothy Urbaniak and Thomas Burzynski
Southern Lake Michigan Fisheries Work Unit – Milwaukee
Department of Natural Resources

This stocking summary is based on stocking records entered by Wisconsin Department of Natural Resources (DNR) staff into the statewide propagation database each time hatchery fish were stocked into Lake Michigan, with lake trout data provided by US Fish and Wildlife Service.

There are four types of information included in this summary report. First, the total number of trout and salmon stocked from 1963-2022 are summarized (pages 3-4) and is intended to provide an overview of long-term trends in the stocking of each species.

The next two summaries account for fish stocked during 2018-2022. Detailed stocking information for 2018-2022 is provided since this year's harvest of all species, except lake trout, will be based primarily on fish stocked in those years. The second summary (pages 5-9) focuses on the number of fish stocked in each county along the Lake Michigan shoreline in 2018-2022. The third summary (pages 11-25) is a set of tables detailing specific stocking sites, the grid location of each stocking site, the specific number and age of fish planted at each site and any identifying fin clips or marks. A grid map of Lake Michigan (Figure 1, page 10) is included to locate stocking sites.

The fourth summary (pages 26-29) focuses on stocked salmon and trout that were clipped, with year ranges based on average life span of each species on Lake Michigan. The ages of fish at the time of stocking are indicated as fingerling (F), yearling (Y) or adult (A). Fish may be clipped on one or more of the following body parts: adipose (A), dorsal (D), right or left maxillary (RM/LM), right or left pectoral fins (RP/LP), right or left ventral fins (RV/LV) or both pectoral/ventral fins (BP/BV). A diagram of a Chinook salmon depicting fin and maxillary locations is included with the summary (Figure 2, page 26).

The "CWT" used in the summaries stands for coded wire tag, referring to fish that have a small wire tag inserted into their snouts at the hatchery. These tags have a number etched into them associated with the year the fish was stocked, the organization that stocked the fish, where the fish was stocked, etc. All yearling steelhead stocked since 2018 (excluding 2021), all lake trout stocked since 2011, and all Chinook salmon stocked 2011-2016 in Wisconsin waters of Lake Michigan were marked with an adipose clip and were implanted with a CWT as part of a lakewide effort to determine the rates of natural reproduction in Lake Michigan.

The Lake Michigan salmonids summarized here presently include fish stocked from varied genetic strains. Brook trout are St. Croix (SC) strain. Brown trout are Seeforellen (S) strain. Strains for both coho and Chinook salmon are Lake Michigan (M). Lake trout strains include Apostle Islands (SAI), Klondike Reef (SKL), Lewis Lake (MLL), Parry Sound (HPS) and Seneca Lake (SEN). Rainbow trout strains include Arlee (A), Chambers Creek (C), Ganaraska (G), Little Manistee River (LMR) and Skamania (SK).

2022 Stocking Summary:

The Wisconsin DNR stocked 50,021 brook trout fingerlings, 433,154 brown trout yearlings, 42,547 brown trout fingerlings, 1,038,745 Chinook salmon fingerlings, 412,273 coho salmon yearlings, 447,195 rainbow trout yearlings and 558,273 rainbow trout fingerlings. Of these totals, 145,095 Chinook fingerlings and 150,497 rainbow fingerlings were provided by Michigan DNR hatcheries. US Fish and Wildlife Service stocked 45,000 lake trout yearlings.
